make it suitable for students as well as PLC experts. The material is presented in an easy-to-understand form using numerous examples, illustrations, and summary tables. There is also a purchaser's guide and a CD-ROM containing two reduced but functional versions of programming systems.

This informative book provides a comprehensive theoretical and practical look at all aspects of PLCs and their associated devices and systems.

This book teaches and demonstrates the basics of Page 23/30

GE Fanuc Programmable Logic Controllers (PLCs). It does this with the GE Fanuc Nano PLC. The Nano uses a simpler (Lite) version of the same Machine Edition programming software as the larger and more expensive GE Fanuc PLCs. Information is provided to help the reader get and operate a Nano PLC. Examples with ladder program diagrams and circuit diagrams are provided to demonstrate Nano and Machine Edition capabilities.

with an essential overview of the stronger hightemperature materials required for key process components, such as membrane wall tubes, high-pressure steam piping and headers, superheater tubes, forged rotors, cast components, and bolting and blading for steam turbines in USC power plants. Advanced materials for future advanced ultrasupercritical power plants, such as superalloys, new martensitic and austenitic steels, are also addressed. Chapters on international research directions complete the volume. The transition from conventional subcritical to supercritical Page 25/30

thermal power plants greatly increased power generation efficiency. Now the introductions of the ultrasupercritical (USC) and, in the near future, advanced ultra-supercritical (A-USC) designs are further efforts to reduce fossil fuel consumption in power plants and the associated carbon dioxide emissions. The higher operating temperatures and pressures found in these new plant types, however, necessitate the use of advanced materials. Provides researchers in academia and industry with an authoritative and systematic overview of the stronger Page 26/30

high-temperature materials required for both ultrasupercritical and advanced ultra-supercritical power plants Covers materials for critical components in ultrasupercritical power plants, such as boilers, rotors, and turbine blades Addresses advanced materials for future advanced ultrasupercritical power plants, such as superalloys, new martensitic and austenitic steels Includes chapters on technologies for welding technologies
