Science, engineering, and technology permeate nearly every facet of modern life and hold the key to solving many of humanity's most pressing current and future challenges. The United States' position in the global economy is declining, in part because U.S. workers lack fundamental knowledge in these fields. To address the critical issues of U.S. competitiveness and to better prepare the workforce, A Framework for K-12 Science Education proposes a new approach to K-12 science education that will capture students' interest and provide them with the necessary foundational knowledge in the

field. A Framework for K-12 Science Education outlines a broad set of expectations for students in science and engineering in grades K-12. These expectations will inform the development of new standards for K-12 science education and, subsequently, revisions to curriculum, instruction, assessment, and professional development for educators. This book identifies three dimensions that convey the core ideas and practices around which science and engineering education in these grades should be built. These three dimensions are: crosscutting concepts that unify the study of science through their common application across science and engineering; scientific and engineering practices; and disciplinary core ideas in the physical sciences, life sciences, and earth and space sciences and for engineering, technology, and the applications of science. The overarching goal is for all high school graduates to have sufficient knowledge of science and engineering to engage in public discussions on science-related issues, be careful consumers of scientific and technical information, and enter the careers of their choice. A Framework for K-12 Science Education is the first step in a process that can inform state-level decisions and achieve a research-grounded basis for improving science instruction and learning across the country. The book will guide standards developers, teachers, curriculum designers, assessment developers, state and district science administrators, and educators who teach science in informal environments.

This book examines emerging defense technologies such as directed energy weapons, nanotech devices, and bioscience applications that have the potential to dominate international relations in the future, just as nuclear weapons and space infrastructure-assisted conventional weapons do now.

The Second Edition of this book is a rearranged and enriched version of the previous edition, composed of feedback and constructive comments from readers. Acupuncture is the most popular form of treatment in Chinese medicine. The theories and practice of acupuncture have been revised and rewritten to give readers a clear idea of how it works and when it is to be utilized. Botanicals, i.e. herbal medicine, form the major core of Chinese medicine practice. The potential of botanicals development is wide: from casting specific biological activities to preventive uses. Three new chapters are offered: (i) for the understanding of the biological activities of herbal medicine, (ii) the products produced from herbs for specific needs, and (iii) the individual's choice for what may suit him/her best. In this present era of information technology, readers should be guided on the use of the Internet and related areas in order to independently secure information for personal use and research needs. The last chapter is provided for this practical purpose. Since the publication of the First Edition, much development has occurred in the field of Chinese medicine. All the chapters have been updated and revised accordingly so that general readers, those looking for effective treatment, as well as those who want to serve their patients better, can have a reliable comprehensive reference.

This volume is part of the Ceramic Engineering and Science Proceeding (CESP) series. This series contains a collection of papers dealing with issues in both traditional ceramics (i.e., glass, whitewares, refractories, and porcelain enamel) and advanced ceramics. Topics covered in the area of advanced ceramic include bioceramics, nanomaterials, composites, solid oxide fuel cells, mechanical properties and structural design, advanced ceramic coatings, ceramic armor, porous ceramics, and more.

Military technology is almost as old as human society. The first

humans sometimes fought one another with sticks and spears. Over the centuries, early peoples developed more powerful and deadlier weapons. The ancient Egyptians built the first warships. The Mayans crafted razor-sharp blades from obsidian, a kind of glass. The ancient Chinese invented the crossbow. This mechanized weapon could shoot arrows much farther than an ordinary bow. What other kinds of weapons did ancient warriors use? What tactics and strategies did they employ? How did they protect themselves from enemies? And how did ancient warfare technology set the stage for our own modern warfare technology? Learn more in Ancient Warfare Technology.

“ The most fundamental difference between ‘ developing ’ and ‘ developed ’ societies is technology, in a broad yet specific sense ” ; so states the author of this important study, Liberation and Technology: Development possibilities in pursuing technological autonomy. The ways in which technology is developed, institutionalized, animated and celebrated, form the core of ‘ development ’ (human, economic, environmental, etc.) and ultimately civilization itself. But ‘ techno-spheres ’ are not only technical. They are also social, political, and ideological. For societies and countries that have long been kept from realizing their own prosperity and dignity, development is also liberation. The main treatise of this book is that each developing society ought to seek to achieve technological autonomy in its quest for positive transformations and prosperity for its people. Technological autonomy is about attaining a high level of self-determination in planning and managing technological affairs. Attaining endogenous capacity to guide and execute decisions on production and innovation; creating and transferring key technological products and services; steering relevant foreign and local investment as well as trade; setting own priorities of development free from external

manipulation; are goals that must be central to such planning efforts. With evidence and argument, and in plain language, this book suggests a novel way of thinking about development, through envisioning and building better techno-social systems. For these reasons this book is a welcome addition to the body of ideas informing practitioners and theorists in the field of development—political leaders, economists, sociologists, engineers, technologists, scientists, scholars, planners and activists who are involved in relevant development processes and liberation struggles.
